

Welcome and Introduction

Nina Zumel and John Mount Data Scientists, Win Vector LLC

What is Regression?

Regression: Predict a numerical outcome ("dependent variable") from a set of inputs ("independent variables").

- Statistical Sense: Predicting the expected value of the outcome.
- Casual Sense: Predicting a numerical outcome, rather than a discrete one.

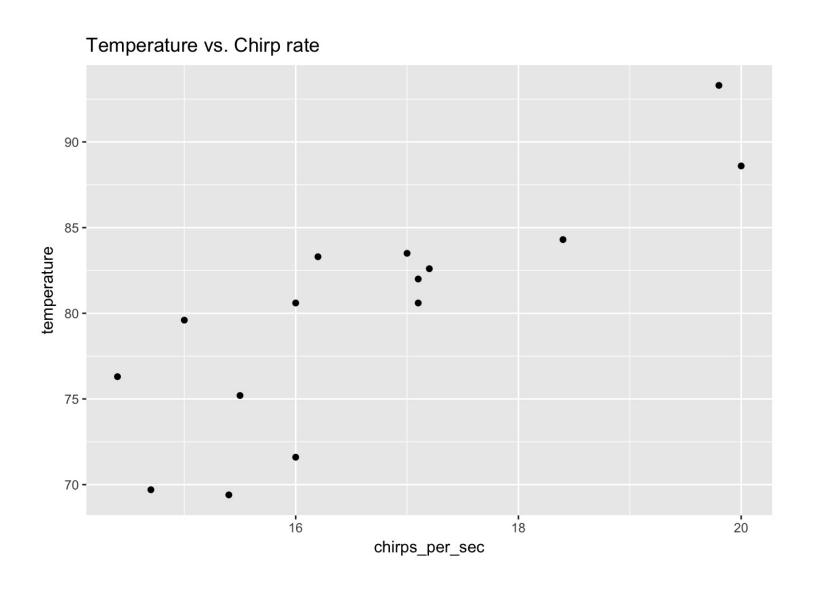

What is Regression?

- How many units will we sell? (Regression)
- Will this customer buy our product (yes/no)? (Classification)
- What price will the customer pay for our product? (Regression)

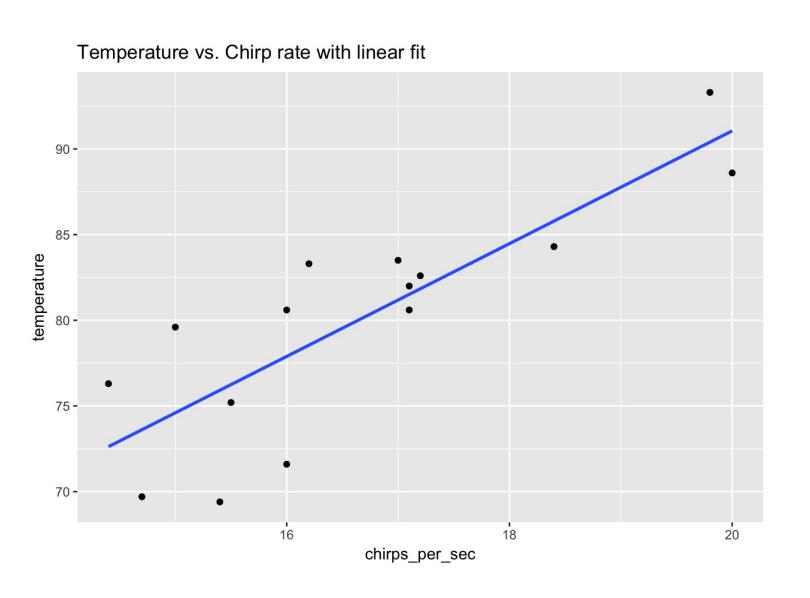

Example: Predict Temperature from Chirp Rate

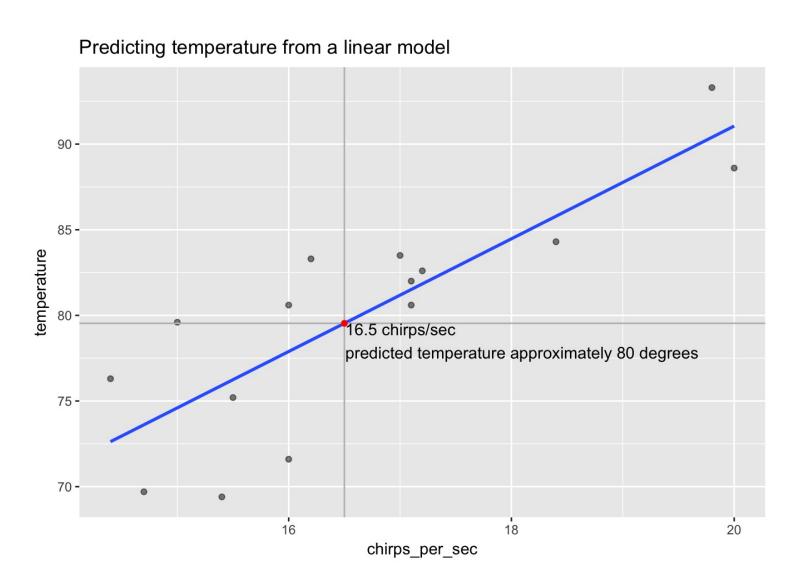

Predict Temperature from Chirp Rate

Predict Temperature from Chirp Rate

Regression from a Machine Learning Perspective

- *Scientific mindset*: Modeling to understand the data generation process
- Engineering mindset: *Modeling to predict accurately

Machine Learning: Engineering mindset

Let's practice!

Linear regression - the fundamental method

Nina Zumel and John Mount Win-Vector LLC

Linear Regression

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots$$

- y is *linearly* related to each x_i
- Each x_i contributes additively to y

Linear Regression in R: Im()

```
> cmodel <- lm(temperature ~ chirps_per_sec, data = cricket)</pre>
```

- formula: temperature ~ chirps_per_sec
- data frame: cricket

Formulas

```
> fmla_1 <- temperature ~ chirps_per_sec
> fmla_2 <- blood_pressure ~ age + weight</pre>
```

- LHS: outcome
- RHS: inputs
 - use + for multiple inputs

```
> fmla_1 <- as.formula("temperature ~ chirps_per_sec")</pre>
```

Looking at the Model

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots$$

```
/ cmodel

##

## Call:

## lm(formula = temperature ~ chirps_per_sec, data = cricket)

##

## Coefficients:

## (Intercept) chirps_per_sec

## 25.232 3.291
```

More Information about the Model

```
> summary(cmodel)
## Call:
## lm(formula = fmla, data = cricket)
##
## Residuals:
             10 Median 30 Max
     Min
   -6.515 -1.971 0.490 2.807 5.001
##
## Coefficients:
                 Estimate Std. Error t value Pr(>|t|)
##
## (Intercept) 25.2323 10.0601 2.508 0.026183 *
## chirps per sec 3.2911 0.6012 5.475 0.000107 ***
## ---
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 3.829 on 13 degrees of freedom
## Multiple R-squared: 0.6975, Adjusted R-squared: 0.6742
## F-statistic: 29.97 on 1 and 13 DF, p-value: 0.0001067
> broom::glance(cmodel)
> sigr::wrapFTest(cmodel)
```

Let's practice!

Predicting once you fit a model

Nina Zumel and John Mount Win-Vector LLC

Predicting From the Training Data

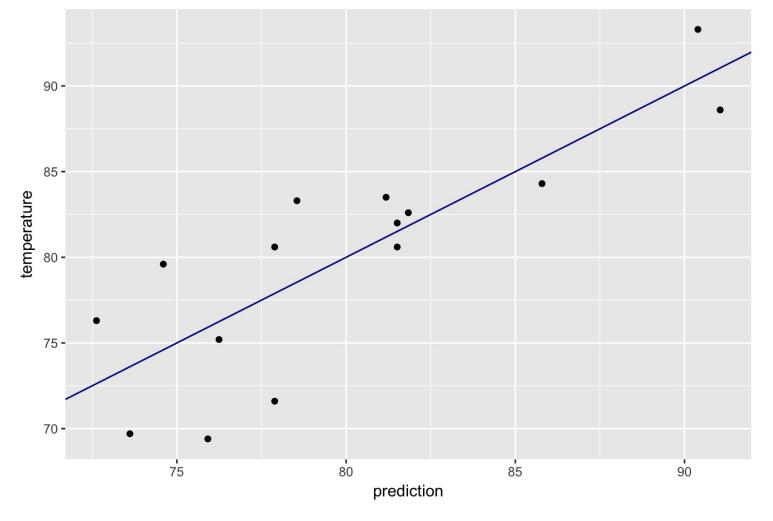

```
> cricket$prediction <- predict(cmodel)</pre>
```

• predict() by default returns training data predictions

Looking at the Predictions

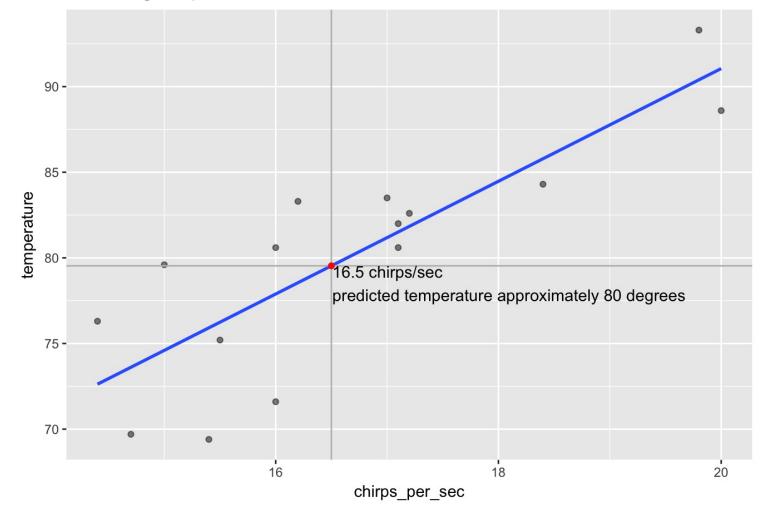

temperature vs. linear model prediction

Predicting on New Data

Predicting temperature from a linear model

Let's practice!

Wrapping up linear regression

Nina Zumel and John Mount Win-Vector, LLC

Pros and Cons of Linear Regression

- Pros
 - Easy to fit and to apply
 - Concise
 - Less prone to overfitting

Pros and Cons of Linear Regression

- Pros
 - Easy to fit and to apply
 - Concise
 - Less prone to overfitting
 - Interpretable

```
## Call:
> lm(formula = blood_pressure ~ age + weight, data = bloodpressure)

## Coefficients:
## (Intercept) age weight
## 30.9941 0.8614 0.3349
```

Pros and Cons of Linear Regression

- Pros
 - Easy to fit and to apply
 - Concise
 - Less prone to overfitting
 - Interpretable
- Cons
 - Can only express linear and additive relationships

Collinearity

• Collinearity -- when input variables are partially correlated.

```
## Call:
> lm(formula = blood_pressure ~ age + weight, data = bloodpressure)

## Coefficients:
## (Intercept) age weight
## 30.9941 0.8614 0.3349
```

Collinearity

- Collinearity -- when variables are partially correlated.
- Coefficients might change sign

```
## Call:
> lm(formula = blood_pressure ~ age + weight, data = bloodpressure)

## Coefficients:
## (Intercept) age weight
## 30.9941 0.8614 0.3349
```

Collinearity

- Collinearity -- when variables are partially correlated.
- Coefficients might change sign
- High collinearity:
 - Coefficients (or standard errors) look too large
 - Model may be unstable

```
## Call:
> lm(formula = blood_pressure ~ age + weight, data = bloodpressure)

## Coefficients:
## (Intercept) age weight
## 30.9941 0.8614 0.3349
```

Coming Next

- Evaluating a regression model
- Properly training a model
